## The 1836-1929 Fire History in Angeles National Forest

Mendenhall. W. M. 1930. Angeles National Forest: History of past fires. Unpublished report on file at the USFS Supervisor's Office, Angeles National Forest.

By listing all the known Angeles National Forest fires between 1836 & 1929, William Mendenhall's laundry-list document accidentally captures the popular change in attitude toward picturesque mountain fires. As people witnessed incredible erosion and flooding over the years, the direct result of conflagration, they overwhelmingly demanded government intervention and got it.

Most all of the fires were the direct result of human ignitions, things like hunters' campfires, smokers, well rig sparks and sheepherders clearing for forage. The first conviction for accidently starting a fire is listed in the text as 1901 from a campfire. Information sources include Dana's book, *Twenty Years Before the Mast*, The Hartford "Courant" (1869), the L.A. Evening Express (1872), the S. F. Bulletin (1881) and the San Francisco Chronicle (1892), as well as the Angeles National Forest records after 1905.

Early on, the fires of the 1870's were remembered somewhat fondly. The "tongues of flame licking the Sierra Madre" were considered beautiful at night and not of much concern. Typical of the period, two Texas cattlemen were known to annually ignite big fires without consequence. This continued until a very wet winter in 1884, when the Southern Pacific Railroad lost its entire infrastructure to flooding. In response to the disaster, purposeful burning was discouraged, and even accidental ignitions punishable.

## **Management Implications**

- These historic Angeles National Forest fires were almost all caused by people. At first, these ignitions were tolerated, but as people witnessed more flooding & erosion, they clamored for government intervention.
- B.F. Allen was federally appointed Forest Agent for Arizona, New Mexico and California. His appointment was in response to the people's outrage at erosion and flooding after three fires denuded chaparral slopes in 1896.

In the particularly dry year of 1896, the lightening-ignited Arroyo fire took six weeks to burn 11,000 acres. Two other campfire-ignited fires burned as well. All of these led to flood damage in both Arroyo and Dalton Canyons for the next two years. The damage created "a storm of protest regarding protection of the reserve." In response, the federal government appointed B.F. Allen as Special Forest Agent for Arizona, New Mexico and California, and gave him a fire suppression budget.

Mendenhall's record is particularly spotty before 1905 while the Forest was still known as the San Gabriel Timberland Reserve. 1905 was the year the Reserve's name was changed to Angeles National Forest and it became a Federal Bureau managed by the United States Forest Service under the Department of Agriculture.
